Results of Groundwater Monitoring at Everest, Kansas, in April 2008

1 Introduction

On September 7, 2005, the Commodity Credit Corporation of the U.S. Department of Agriculture (CCC/USDA) presented a *Scoping Memo* (Argonne 2005) for preliminary consideration by the Kansas Department of Health and Environment (KDHE), suggesting possible remedial options for the carbon tetrachloride contamination in groundwater at Everest, Kansas. The suggested approaches were discussed by representatives of the KDHE, the CCC/USDA, and Argonne at the KDHE office in Topeka on September 8-9, 2005, along with other technical and logistic issues related to the Everest site. In response to these discussions, the KDHE recommended (KDHE 2005) evaluation of several remedial processes, either alone or in combination, as part of a Corrective Action Study (CAS) for Everest. The primary remedial processes suggested by the KDHE were the following:

- Hydraulic control by groundwater extraction with aboveground treatment
- Air sparging (AS) coupled with soil vapor extraction (SVE) in large-diameter boreholes (LDBs)
- Phytoremediation

As a further outcome of the 2005 meeting and as a precursor to development of a possible CAS, the CCC/USDA completed the following supplemental investigations at Everest to address several specific technical concerns discussed with the KDHE:

- Construction of interpretive cross sections at strategic locations selected by the KDHE along the main plume migration pathway, to depict the hydrogeologic characteristics affecting groundwater flow and contaminant movement (Argonne 2006a).
- A field investigation in early 2006 (Argonne 2006b), as follows:

- Installation and testing of a production well and associated observation points, at locations approved by the KDHE, to determine the response of the Everest aquifer to groundwater extraction near the Nigh property.
- Groundwater sampling for the analysis of volatile organic compounds (VOCs) and the installation of additional permanent monitoring points at locations selected by the KDHE, to further constrain the existing contaminant plume.
- Resampling of all existing permanent monitoring points for VOCs and biodegradation parameter analyses, at the request of the KDHE.

On the basis of these studies (Argonne 2006a,b) and the CCC/USDA's past investigations at Everest (Argonne 2006c), the CCC/USDA concluded that groundwater extraction is not an effective remedial option for the main body of the groundwater plume, and the KDHE concurred (KDHE 2006); the KDHE later noted, however (KDHE 2007a), that this and other technologies might represent viable remedial options in the event of further downgradient migration of the plume toward the intermittent creek.

In February 2007, the CCC/USDA presented preliminary analyses of (1) the AS-SVE remedial alternative, incorporating the use of LDBs, and (2) the risks to human health and the environment posed by the observed carbon tetrachloride plume in groundwater (Argonne 2007a). The results of these analyses demonstrated the following:

- Neither groundwater extraction nor AS-SVE in LDBs represents a practical approach for effective remediation of the groundwater contamination at Everest (near the Nigh property).
- Periodic sampling and analyses for VOCs conducted by the CCC/USDA documented that the areal extent and range of carbon tetrachloride concentrations detected in the groundwater plume at Everest had changed relatively little from 2000 to 2006.
- Estimates of groundwater flow and contaminant migration times, based on the hydrogeologic properties of the groundwater flow system identified at Everest

(Argonne 2003, 2006b,c), indicated that, *at minimum*, approximately 4 years would be required for the carbon tetrachloride plume (in the subsurface) to reach the vicinity of the intermittent creek directly west of the Nigh property, and more than 20 years would be required for the contamination to reach the identified groundwater discharge area southwest of the Nigh property.

- The existing (January-March 2006) plume posed no immediate danger of contamination to the surface waters of the intermittent creek.

In light of these observations, the CCC/USDA proposed a phased program — over approximately 2-3 years — of groundwater sampling, surface water sampling, and related monitoring activities at Everest to (1) identify locations where a phytoremediation system would be effective and determine that area's extent and (2) support the potential development of a phytoremediation treatment alternative for the site. The recommended elements of the monitoring program are summarized in Table 1.1. In conjunction with this program, both the CCC/USDA and the KDHE recommended the construction of several new monitoring wells, at locations along and near the intermittent creek west of the Nigh property (Argonne 2007b; KDHE 2007b). The additional well locations (Figure 1.1) were targeted to provide information on the following:

- The hydrogeologic characteristics and continuity of the Everest aquifer unit along the upgradient reach of the intermittent creek, where implementation of a phytoremediation remedy might be feasible.
- The depths to groundwater and the patterns of groundwater flow near the intermittent creek.
- The rates and pathways of possible contaminant approach toward the creek, along with the area amenable to possible phytoremediation.

In consultation with the KDHE, the CCC/USDA has made repeated efforts to obtain access to the private property adjacent to the creek (farmed by Tom Stirton and owned by Phillip Shade) that is required for installation and periodic sampling of the proposed new monitoring wells. To date, however, the CCC/USDA has been unsuccessful in these negotiations. Recent discussions with the property owner further suggest that an access agreement is unlikely to be

forthcoming. The CCC/USDA therefore conducted groundwater sampling for VOCs analyses in the existing network of monitoring points at Everest in April 2008, in order to redefine the carbon tetrachloride plume and assess any changes in the concentrations and the areal extent of the groundwater contamination that might have occurred since the last sampling event in January-March 2006. This report presents the results of the April 2008 groundwater sampling event.

TABLE 1.1 Summary of the sampling and monitoring recommended in 2007 (Argonne 2007a) for 2-3 years (Phase I and Phase II).

Activity	Locations	Frequency	Phase(s)
Groundwater sampling at permanent monitoring points, for VOCs analyses and selected biodegradation indicators	DW06, MW1, MW2, MW3, MW4, MW5, PT1, SB01, SB09, SB16, SB18, SB34, SB49, SB60, SB62, SB63, SB64, SB68, SB72, SB77, SB78, SB79S, SB79D, SB80, SB88	Annually	I and II
Groundwater sampling at wells on the plume margins, plus MW4 and SB60	MW3, MW4, SB49, SB60, SB62, SB63, SB64, SB72, SB78, SB79S, SB79D, SB80	Twice annually (once in coincidence with the annual event, plus one additional event) Four times annually (once in coincidence with the annual event, plus three additional events)	I (1 st year) I (2 nd year) and II
Surface water sampling in the groundwater seepage and upstream creek areas, for VOCs analyses only	Two locations in groundwater seepage area and three along upstream portion of intermittent creek	Twice annually Four times annually	I (1 st year) I (2 nd year) and II
Groundwater level monitoring at existing permanent monitoring points	MW2, MW4, SB09, SB34, SB62, SB63	Continuously (water level recorders)	I and II
Groundwater and surface water level monitoring in new locations	Locations in the downstream and perennial parts of the creek	Continuously (water level recorders)	II
Establishment of weather station	In proposed phytoremediation area	Continuously (automated data logging)	II
Survey of natural vegetation types and density	Along creek trend	One time	II
Sampling of natural plants for VOCs analyses	Locations to be selected along creek trend	Twice annually	II

2 Sampling and Analysis Activities

2.1 Measurement of Groundwater Levels

During the current monitoring period (March 2006 to April 2008), groundwater levels were monitored continuously at selected locations along the identified groundwater plume and also measured manually at the locations where groundwater samples were collected on April 1-9, 2008. The groundwater data are presented and discussed in Section 3.1.

Water level sensors incorporating data loggers have been used for automatic, continuous recording of groundwater levels at numerous locations at the Everest site since November 2002 (Argonne 2003, 2006b). Groundwater levels were monitored at 14 locations (MW2, MW3, MW4, SB09, SB16, SB34, SB49, SB62, SB63, SB72, SB77, SB78, SB79S, SB80) after completion of the 2006 site investigation activities (Figure 2.1). In July 2006, with the approval of the KDHE, the active monitoring network was limited to 6 locations (MW2, MW4, SB09, SB34, SB62, SB63) along the approximate central axis of the identified groundwater plume (Figure 2.1), though the entire network remains intact and is available for further automated monitoring if the need arises.

During the current monitoring period, the stored data for each of the wells being automatically monitored were retrieved from the data loggers on July 22, 2006; January 10, 2007; July 11, 2007; and March 20, 2008. Depths to groundwater were also measured manually in these wells at the time of each data download.

On April 1-9, 2008, 24 monitoring wells and permanent piezometers (MW1-MW5, PT1, SB01, SB09, SB16, SB18, SB34, SB49, SB60, SB62-SB64, SB68, SB72, SB77, SB78, SB79S, SB79D, SB80, SB88; Figure 2.2) and the Nigh private well (DW06; Figure 2.2) were sampled for VOCs analyses. Before sampling, a water level indicator was used to measure the depth to groundwater and the total depth of each well, to within 0.01 ft, from the top of the well casing.

Water level data collected prior to the January-March 2006 field investigation (Argonne 2006b) were reported previously (Argonne 2003, 2006c).

2.2 Groundwater Sampling and Analyses

On April 1-9, 2008, groundwater samples were collected for VOCs analyses at the 25 locations shown in Figure 2.2. The analytical results are presented and discussed in Section 3.2.

At the request of the KDHE, the CCC/USDA and Argonne have adopted a low-flow (minimal drawdown) methodology for the purging and sampling of monitoring wells and piezometers in Kansas. These procedures are conducted in accord with U.S. Environmental Protection Agency (EPA) procedure EPA/540/S-95/504 (Puls and Barcelona 1996), as requested by the KDHE.

Purging and sampling in the April 2008 monitoring event at Everest were performed by using a GeoControl ProTM bladder pump system, in conjunction with periodic manual measurement of water levels to ensure that the required criteria for minimal drawdown were met. Samples were collected for analysis after stabilization of the diagnostic groundwater parameters temperature, pH, conductivity, dissolved oxygen (DO), and oxidation-reduction potential (ORP), in keeping with the EPA (Puls and Barcelona 1996) procedure. A YSI Instruments 556 MPS multi-parameter probe, meter, and flow cell were used for monitoring of groundwater parameters. A field determination of reduced iron (Fe^{II}) content was also made for each sample, by using a Hach Model 820 colorimeter and appropriate reagents.

The sequence of activities during the April 2008 groundwater sampling event is summarized in Appendix A.

The groundwater samples were collected in appropriate laboratory containers, labeled, packaged, and chilled to 4°C by placement in ice-filled coolers. The samples were shipped by an overnight delivery service to the Applied Geosciences and Environmental Management (AGEM) Laboratory at Argonne for VOCs analyses with EPA Method 524.2 (EPA 1995). Aliquots of selected samples (chosen in the field) were also shipped to Envirosystems, Inc., Columbia, Maryland, for verification VOCs analyses.

2.3 Handling and Disposal of Investigation-Derived Waste

Purge water generated as potentially contaminated investigation-derived waste was containerized on-site. The accumulated purge water was sampled on June 26, 2008, and analyzed by Pace Analytical Services, Inc., Lenexa, Kansas. Methods used were EPA Method 5030/8260 for VOCs, EPA Method 504.1 for ethylene dibromide, and EPA Method 300 for nitrate as nitrogen. No contamination was detected (Appendix B). With the approval of the KDHE (2008), the water was discharged on-site on July 2, 2008.

2.4 Quality Control for Sample Collection, Handling, and Analysis

The quality assurance/quality control procedures followed during the April 2008 monitoring event for collection, handling, and analysis of water samples are described in detail in the *Master Work Plan* (Argonne 2002). Results of these activities are summarized as follows:

- Sample integrity was maintained successfully throughout the collection, shipping, and analysis activities by the use of custody seals and chain-of-custody records.
- All samples were received with custody seals intact and adequately preserved. All samples were analyzed within required holding times.
- Carbon tetrachloride and chloroform were not detected in trip blanks accompanying samples shipped for organic analysis. Equipment rinsates and laboratory method blanks were also free of carbon tetrachloride and chloroform contamination.
- Groundwater samples were analyzed at the AGEM Laboratory by using EPA Method 524.2. Quality control limits were met for the analyses. The accuracy and precision of the analytical methodology were evident in the results for three replicate samples and for duplicate analyses of three additional samples. For samples in which no contamination or trace contamination was detected, the associated quality control analyses showed similar results. For samples in which the contaminants were detected above the reporting limit of 1.0 µg/L,

the relative percent difference values between the initial analyses and the associated quality control analyses ranged from 2.5% to 7.9% for carbon tetrachloride and from 3.7% to 16% for chloroform. The groundwater analysis data from the AGEM Laboratory are acceptable for quantitative determination of contaminant distribution.

- Quality control limits were met in three verification analyses of groundwater samples with EPA Contract Laboratory Program methodology by Envirosystems. The results (Appendix C) support the AGEM Laboratory data. Methylene chloride, a common laboratory contaminant detected in all samples and blanks analyzed by Envirosystems, was not detected in analyses by the AGEM Laboratory.

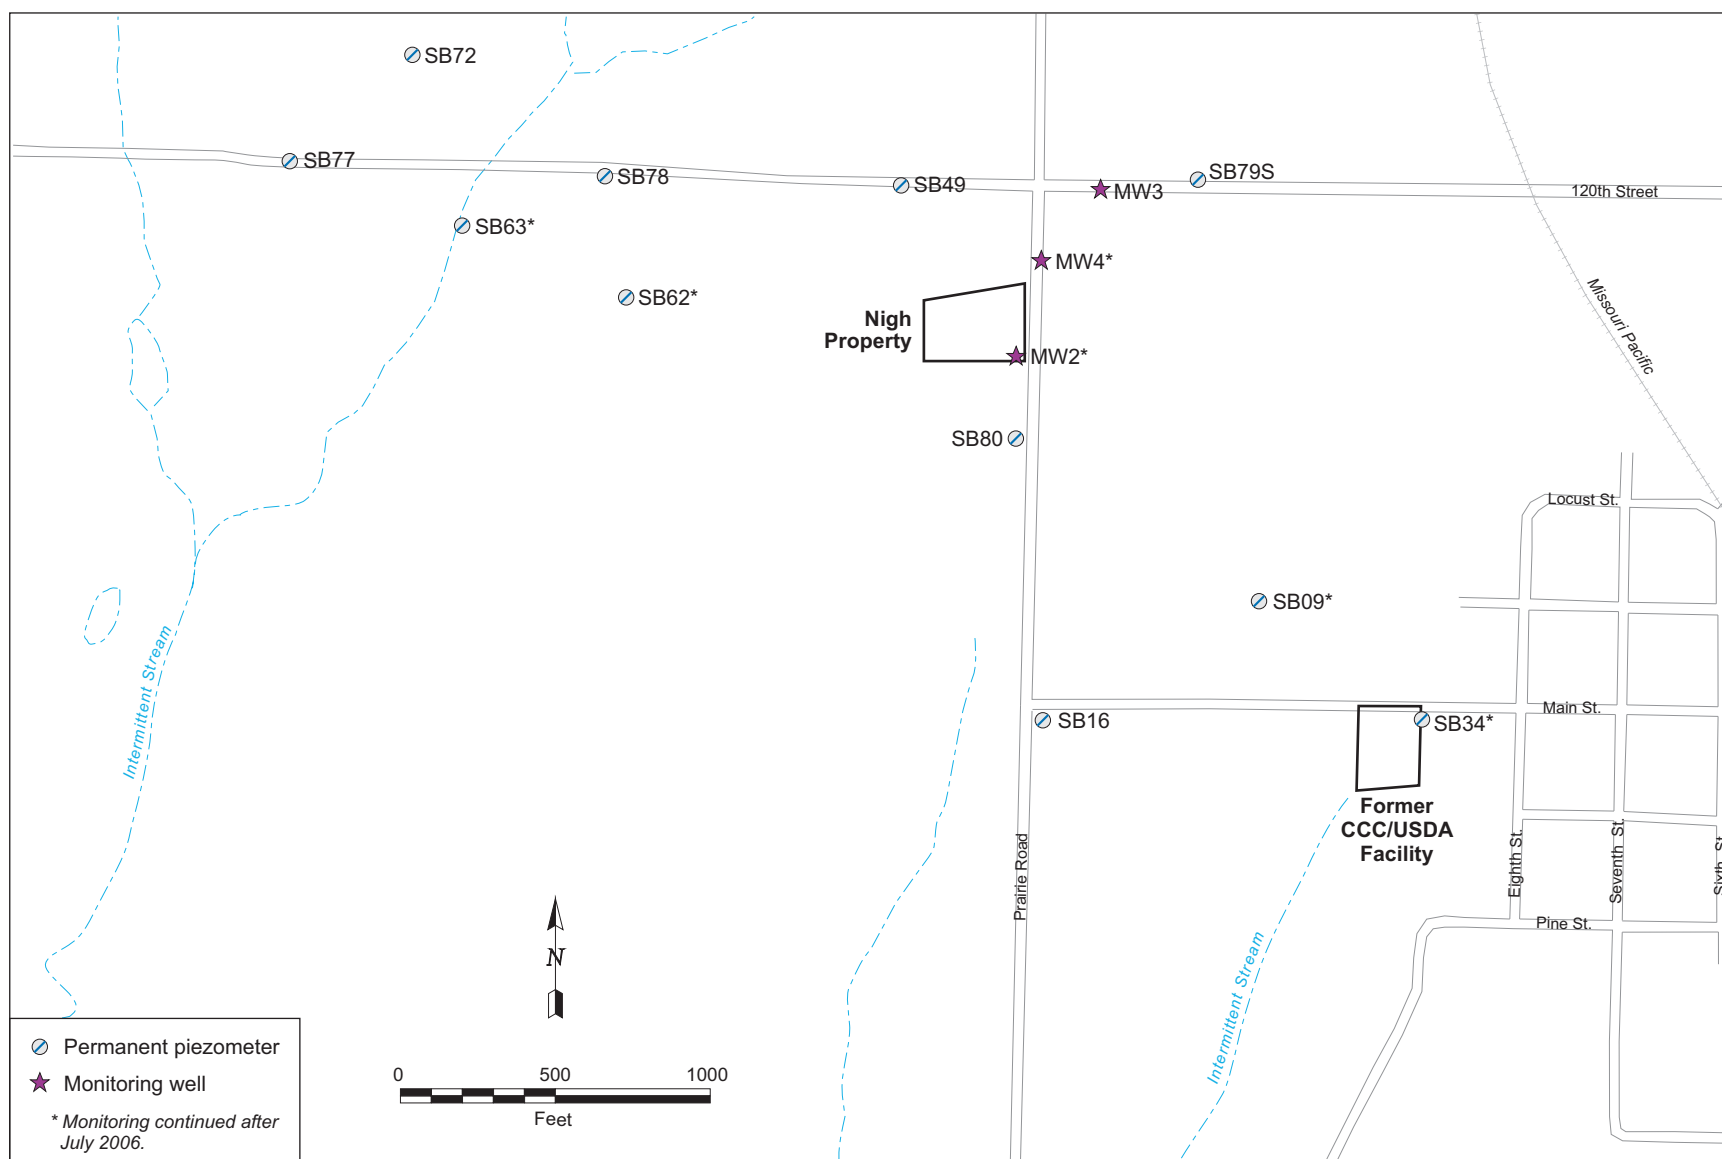

FIGURE 2.1 Wells equipped with water level sensors for groundwater level monitoring at the completion of the 2006 investigation.

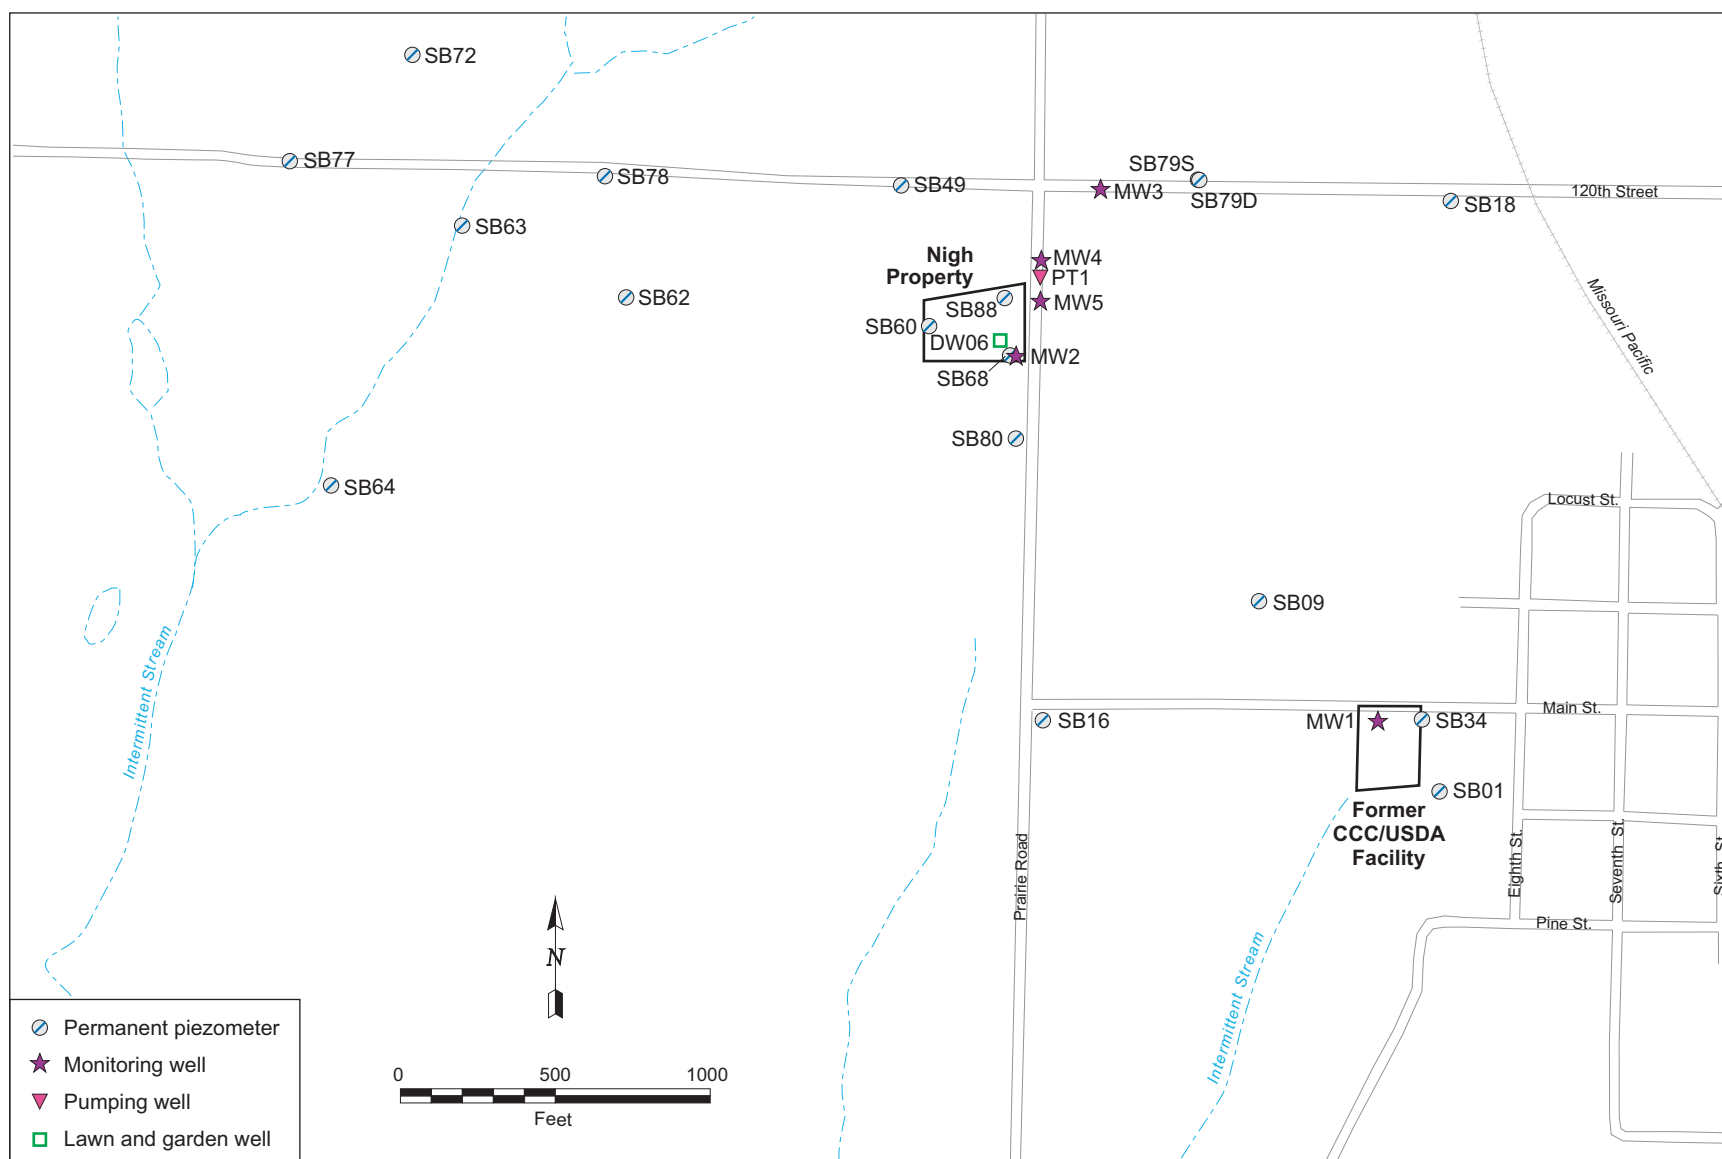

FIGURE 2.2 Groundwater sampling locations in April 2008.

3 Results and Discussion

3.1 Groundwater Level Data

During the current review period (March 2006 to April 2008), groundwater levels were measured manually in each of the wells being automatically monitored — and the data loggers were also downloaded — on July 22, 2006; January 10, 2007; July 11, 2007; and March 20, 2008. In addition, depths to groundwater were measured in each of the wells sampled on April 1-9, 2008. The hand-measured water level data are in Table 3.1.

The automatically recorded water level data obtained during the current review period are in Supplement 1, on the compact disc (CD) inside the back cover of this report. Hydrographs generated from the complete suite of recorder data obtained at Everest since November 2002 are in Figures 3.1 and 3.2. Logger data collected prior to the January-March 2006 field investigation (Argonne 2006b) were reported previously (Argonne 2003, 2006c). Data absences in the records for MW2, SB09, SB34, and SB62 are the result of intermittent equipment or battery failures.

The hydrographs in Figure 3.1 for the monitoring locations west of the Nigh property indicate that groundwater levels in that area have remained relatively constant since 2002. Only the hydrograph for monitoring point SB63 shows a fairly pronounced seasonal response; SB63 is immediately adjacent to the intermittent creek channel (Figure 2.1).

The flat intervals of the SB63 hydrograph observed in late 2006 and late 2007 (at an elevation of approximately 1079 ft AMSL [above mean sea level]) indicate periods when the static water level in SB63 dropped below the position of the installed water level sensor. These flat intervals are the most pronounced manifestation of the ongoing seasonal variations in water levels recorded at SB63. These seasonal changes are characterized by steep drawdown curves starting in early summer and gentle recovery curves starting in late fall. These patterns suggest the influence of possible annual water extraction events, of which the 2006 and 2007 events are the most pronounced. The annual extraction events could result from seasonal water uptake by the trees growing at the SB63 location. The following observations support this hypothesis:

- The drawdowns occur locally and have magnitudes of at least 3-4 ft (> 4 ft in 2006 and 2007).

- The nearby creek is intermittent, and no nearby standing surface water fluctuates at such a scale.
- If surface water in the intermittent creek was recharging to groundwater at SB63, the hydrograph should show the relatively steep rising curves with gentle falling curves that characterize the hydrographs in Figure 3.2, for locations east of the Nigh property.
- The aquifer at SB63 apparently cannot provide sustainable water for the relatively small number of trees at that location. In contrast, the aquifer at SB64 apparently provides a larger number of nearby trees with sufficient water, with no recorded seasonal drawdown (Figure 3.3). These observations are consistent with the lower hydraulic conductivity values (1-2 ft/day) estimated for locations west of the Nigh property (near SB63) than at SB64 (approximately 10 ft/day) (Argonne 2006c).
- No private well that could explain the observed drawdown exists in the immediate vicinity of SB63.

The hydrographs in Figure 3.2 for monitoring locations east of the Nigh property show that the ambient water levels in that area rose steadily during the period of record (by as much as approximately 15 ft at SB09). All of the water levels in this area show pronounced responses to seasonal recharge events.

Argonne's previous investigations (Argonne 2003, 2006c) determined that groundwater flow in the Everest aquifer unit occurs at a low rate, with hydraulic conductivity estimates generally < 3 ft/day. The flow is driven primarily by groundwater recharge to the southeast of the former CCC/USDA facility and by discharge along the lower (perennial) reaches of the creek southwest of the Nigh property, resulting in a relatively stable pattern of groundwater flow across the investigation area. The detailed pathways of groundwater flow and contaminant migration are influenced, however, by the hydrogeologic heterogeneity of the aquifer unit, particularly by a region of reduced sand content and hence decreased permeability near the Nigh property. Near the creek, the resolution of the groundwater flow pattern is limited by the sparse distribution of monitoring points. This sparsity was the reason for the 2007 proposal to install additional monitoring wells near the creek (Argonne 2007b).

Figures 3.4-3.7 show the configuration of the potentiometric surface at the site, with representative data obtained on November 9, 2002; November 15-16, 2003; February 24, 2006; and April 1-9, 2008. These figures demonstrate that the potentiometric surface — and hence the apparent groundwater flow patterns influencing the contaminant distribution — have remained consistent with the above interpretation, despite the documented temporal and areal fluctuations in water levels. Furthermore, the stability of groundwater flow demonstrated by the water level observations made since 2002 would imply a consistent contaminant distribution pattern during that interval.

Contaminant distribution is discussed further in Section 3.2.

3.2 Groundwater Analysis Results

The analytical data for VOCs and the field-measured parameters (temperature, pH, conductivity, DO, ORP, and Fe^{II}) for the groundwater samples collected in April 2008 are in Table 3.2, together with data for the sampling event in January-March 2006. The April 2008 data for carbon tetrachloride and chloroform are illustrated in Figures 3.8 and 3.9, respectively. The results of the January-March 2006 analyses for carbon tetrachloride are presented in Figure 3.10.

The results of DO, ORP, and Fe^{II} measurements show that the biodegradation parameters remained at levels similar to those in 2006 (Table 3.2). These results indicate that no significant changes in the chemical and biological environments occurred during the present monitoring period.

Carbon tetrachloride was detected at 15 of the 25 locations sampled in April 2008, at concentrations ranging from $< 1 \mu\text{g/L}$ (below the method quantitation limit of $1.0 \mu\text{g/L}$ for this analysis) to $244 \mu\text{g/L}$ (at MW4), near the Nigh property (Figure 3.8). Chloroform concentrations ranging from $< 1 \mu\text{g/L}$ to $7.9 \mu\text{g/L}$ were identified at 10 of the 25 sampling locations (Figure 3.9). The April 2008 data reflect a decrease in the maximum concentration of carbon tetrachloride in the groundwater plume since the 2006 sampling event, from a previous high of $316 \mu\text{g/L}$ (Figure 3.10) to the present $244 \mu\text{g/L}$ (both maximum values at MW4).

Figures 3.8 and 3.10 indicate relatively few substantial changes in carbon tetrachloride concentrations or the areal extent of the contamination in groundwater at Everest since the 2006

sampling event. Carbon tetrachloride levels at monitoring points in the upgradient portion of the plume, near the former CCC/USDA facility (MW1, SB09, SB34; Figure 3.8), show a slight decrease relative to the 2006 results (Figure 3.10); however, the 2008 concentrations at SB09 and SB34 (51 µg/L and 3.2 µg/L, respectively) remained in the range of values detected before the 2006 sampling event (at SB09, 22.8 µg/L in 2003 and 57 µg/L in 2005; at SB34, < 1 µg/L in 2003 and 9.2 µg/L in 2005).

The carbon tetrachloride concentrations determined in April 2008 for most of the monitoring locations in the immediate vicinity of the Nigh property showed no clear pattern of increase or decrease relative to the corresponding 2006 concentrations. In contrast, carbon tetrachloride was not detected (at a laboratory detection limit of 0.1 µg/L) in a groundwater sample collected from the Nigh private well (DW06) with the low-flow method in April 2008, though a carbon tetrachloride concentration of 218 µg/L had been identified in a sample collected from this well in 2006 after purging of three well volumes (more than 300 gal). The absence of carbon tetrachloride in the sample from DW06 in 2008 is probably the result of sample collection by the low-flow method (without purging) from the water in the large-diameter, hand-dug well. The conventional sampling method with purging should be used in future monitoring to obtain a representative sample from this well; its construction is not suitable for low-flow sampling.

Increased concentrations of carbon tetrachloride were identified in April 2008 at monitoring points SB49 and MW3 (north of the Nigh property), and a trace of carbon tetrachloride was detected at SB18 (directly north of the former CCC/USDA property). No carbon tetrachloride was detected, however, at monitoring points SB79S and SB79D, along the inferred northern margin of the plume between locations MW3 and SB18. (A trace level of carbon tetrachloride was identified at monitoring point SB79D in the 2006 sampling event; Figure 3.10). The 2008 carbon tetrachloride concentrations at locations SB49 (2.1 µg/L) and MW3 (7.6 µg/L) are below the concentration of 12 µg/L found in 2001 in boring SB46 (between MW3 and SB79, along the northern margin of the plume; see location in Figure 3.8).

Monitoring point SB62 lies along the inferred approximate central axis of the downgradient portion of the groundwater plume. A trace concentration (< 1 µg/L) of carbon tetrachloride was detected at SB62 in April 2008; however, the observed level was comparable to the results for both the May 2005 and January-March 2006 sampling events (Argonne 2006b and Figure 3.10, respectively). Near the intermittent creek, no carbon tetrachloride was detected

at monitoring points SB63, SB64, SB72, SB77, and SB78 in April 2008 (Figure 3.8), or at SB63, SB64, SB77, and SB78 in 2006 (Figure 3.10). A trace concentration of carbon tetrachloride previously identified at monitoring point SB72, northwest of the upper reach of the intermittent creek west of the Nigh property (Figure 3.10), was not confirmed by the April 2008 sampling results.

The results of the April 2008 monitoring reported here, together with the preliminary evaluation of plume migration at Everest (Argonne 2007a), indicate that the areal extent of the plume has changed little since 2000. The apparent slow migration of the plume observed is qualitatively consistent with the low groundwater flow and contaminant migration rates predicted for the Everest plume on the basis of the identified hydrogeologic properties of the Everest aquifer unit (Argonne 2007a). Taken together, the results of the CCC/USDA investigations demonstrate no significant lateral or downgradient expansion of the carbon tetrachloride plume during the eight-year period from 2000 to 2008.

Figures 3.11-3.13 illustrate the interpreted plume configurations during the period of CCC/USDA investigation. Figure 3.11 is based on combined data from March-April 2001 and November 2002, Figure 3.12 on March 2006 data, and Figure 3.13 on April 2008 data. The figures demonstrate that the overall extent of the plume has been constrained effectively and has not changed significantly during the period of observation. The internal contaminant distribution in the plume continues to evolve, however, with decreasing contaminant concentrations. The highest carbon tetrachloride concentration, 919 $\mu\text{g/L}$, occurred at location SB33 in March-April 2001 (Figure 3.11). The three plume maps illustrate a steady decline in carbon tetrachloride concentrations through time, from 2001 to 2008.

Figure 3.11 reflects the results of one-time sampling at many locations during the major field investigations at Everest. Access restrictions now prevent resampling at a number of those locations. Figures 3.12 and 3.13 reflect the present lower sample density of the permanent monitoring points.

4 Conclusions and Recommendations

4.1 Conclusions

The findings of the April 2008 monitoring event at Everest support the following conclusions:

- Measurements of groundwater levels obtained manually and through the use of automatic recorders have demonstrated a consistent pattern of groundwater flow — and inferred contaminant migration — to the north-northwest from the former CCC/USDA facility and toward the Nigh property, and then west-southwest from the Nigh property toward the intermittent creek.
- The range and areal distribution of carbon tetrachloride concentrations identified in the groundwater at Everest in April 2008 are generally consistent with previous results. All of the existing data from the current monitoring period (2006-2008) and the previous investigations (2000-2006) indicate no significant downgradient extension of the carbon tetrachloride plume during the eight-year period from 2000 to 2008.
- The slow migration of the plume suggested by the monitoring data is qualitatively consistent with the low groundwater flow and contaminant migration rates previously estimated for the Everest plume on the basis of the site-specific properties of the aquifer unit.
- Comparison of the interpreted plume configuration at three stages during the period of CCC/USDA investigation (March-April 2001 and November 2002, March 2006, and April 2008) demonstrated that the overall extent of the plume has been constrained effectively and has not changed significantly during the period of observation. The internal contaminant distribution in the plume has continued to evolve, with decreasing contaminant concentrations. The three plume maps illustrate a steady decline in carbon tetrachloride concentrations through time, from 2001 to 2008.

4.2 Recommendations

The phased monitoring program proposed in 2007 for the Everest site by the CCC/USDA (Argonne 2007a) and approved by the KDHE (2007a) was developed to address two primary technical objectives, as follows:

- To periodically collect groundwater monitoring data at a sampling frequency sufficient to document the evolution of the carbon tetrachloride plume and hence to be protective of human health, the environment, and (particularly) the quality of the surface waters of the intermittent creek west of the Nigh property.
- To provide essential information on (1) the hydrogeologic characteristics of the aquifer unit in the immediate vicinity of the intermittent creek, (2) detailed depths to groundwater, and (3) pathways of groundwater flow and contaminant migration near the creek. This information is needed to support the technical development of a possible phytoremediation (or alternative) treatment strategy for this site.

The results of the April 2008 groundwater sampling event discussed in this report are consistent with earlier CCC/USDA and Argonne findings. These results demonstrate that the migration rate of the carbon tetrachloride plume west of the Nigh property (toward the intermittent creek) is very slow, as predicted on the basis of Argonne's previous calculations (Argonne 2007a).

The next monitoring event is scheduled for October 2008. However, in light of the above findings, the CCC/USDA and Argonne propose that the program of relatively frequent groundwater sampling originally proposed for Everest (summarized in Table 1.1), requiring twice yearly sampling for one year followed by quarterly sampling thereafter (as requested by the KDHE), is not technically warranted at this time. In view of funding limitations, the expenditure of the considerable effort required for implementation of the monitoring scheme as presently outlined would generate a large volume of data that might ultimately prove of limited value for the successful identification of a suitable remedy for this site.

Therefore, in the absence of evidence for plume migration over an observation period of eight years, the CCC/USDA and Argonne recommend the implementation of a simplified monitoring program of groundwater sampling for VOCs analyses in alternate years at the 25 monitoring points sampled in April 2008 (all locations shown in Figure 2.2). A return to conventional sampling with purging needs to be considered for future monitoring of the Nigh well (DW06). The simplified monitoring program should continue until the identified plume conditions at the site indicate a technical justification for more accelerated monitoring and investigation near the creek to support the analysis of remedial alternatives.

RE: Project: ANL - Everest WW
Pace Project No.: 6042583

Dear Lisa Larsen:

Enclosed are the analytical results for sample(s) received by the laboratory on June 27, 2008. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Trudy Gipson

QUALIFIERS

Project: ANL - Everest WW
Pace Project No.: 6042583

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

C9 Common Laboratory Contaminant.

L3 Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

RE: Report #0080401

Dear Jorge,

Enclosed is the Analytical Data Package for the samples received on April 03, 2008 for volatile organics analysis by USEPA SW846 method 8260B/CLP SOW OLM04.3 protocols.

Please do not hesitate to call if you have any questions, comments, or require additional information.

Sincerely,

Mohan Khare Ph.D.
President/CEO

Report#080188

Narrative

This analytical data package contains the volatile organic analysis by USEPA SW-846 Method 8260B and CLP protocols for samples received April 03, 2008

The chain of custody document for this report is in section 2, the analytical data summary, sample data, and standard data is in section 3.
